## 1. The ten best-selling video games

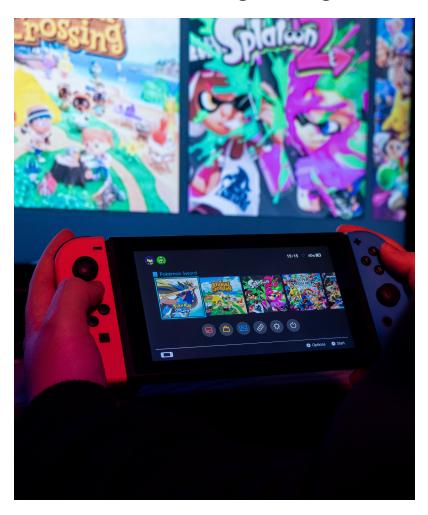

Photo by Dan Schleusser on Unsplash.

Video games are big business: the global gaming market is projected to be worth more than \$300 billion by 2027 according to Mordor Intelligence. With so much money at stake, the major game publishers are hugely incentivized to create the next big hit. But are games getting better, or has the golden age of video games already passed?

In this project, we'll explore the top 400 best-selling video games created between 1977 and 2020. We'll compare a dataset on game sales with critic and user reviews to determine whether or not video games have improved as the gaming market has grown.

Our database contains two tables. We've limited each table to 400 rows for this project, but you can find the complete dataset with over 13,000 games on Kaggle.

## game\_sales

column	type	meaning		
game	varchar	Name of the video game		

column type		meaning
platform	varchar	Gaming platform
publisher	varchar	Game publisher
developer	varchar	Game developer
games_sold	float	Number of copies sold (millions)
year	int	Release year

#### reviews

column	type	meaning
game	varchar	Name of the video game
critic_score	float	Critic score according to Metacritic
user_score	float	User score according to Metacritic

Let's begin by looking at some of the top selling video games of all time!

10 rows affected.

# 2. Missing review scores

Wow, the best-selling video games were released between 1985 to 2017! That's quite a range; we'll have to use data from the reviews table to gain more insight on the best years for video games.

First, it's important to explore the limitations of our database. One big shortcoming is that there is not any reviews data for some of the games on the game sales table.

```
In [61]:
          %%sql
          postgresql:///games
          -- Join games sales and reviews
          -- Select a count of the number of games where both critic score and user score
          select count(q.qame)
          from game sales as g
          left join reviews as r
          on g.game=r.game
          where critic score is null and user score is null;
         1 rows affected.
Out[61]: count
            31
In [62]:
          %%nose
          last output =
          def test output type():
              assert str(type(last output)) == "<class 'sql.run.ResultSet'>", \
              "Please ensure an SQL ResultSet is the output of the code cell."
          results = last output.DataFrame()
          def test results():
```

```
assert results.shape == (1, 1), \
"The query should return just one value, a count of games where both critic_
assert results.columns.tolist() == ["count"], \
'The results should have just one column, called "count".'
assert last_output.DataFrame().loc[0, 'count'] == 31, \
"There should be 31 games where both critic_score and user_score are null."
```

Out[62]: 2/2 tests passed

# 3. Years that video game critics loved

It looks like a little less than ten percent of the games on the <code>game\_sales</code> table don't have any reviews data. That's a small enough percentage that we can continue our exploration, but the missing reviews data is a good thing to keep in mind as we move on to evaluating results from more sophisticated queries.

There are lots of ways to measure the best years for video games! Let's start with what the critics think.

```
In [63]:
    *%sql
    -- Select release year and average critic score for each year, rounded and alias
    -- Join the game_sales and reviews tables
    -- Group by release year
    -- Order the data from highest to lowest avg_critic_score and limit to 10 result
    select year, round(avg(critic_score),2) as avg_critic_score
    from game_sales as g
    inner join reviews as r
    on g.game=r.game
    group by year
    order by avg(critic_score) desc
limit 10;
```

\* postgresql:///games
10 rows affected.

#### Out[63]:

year	avg_critic_score
1990	9.80
1992	9.67
1998	9.32
2020	9.20
1993	9.10
1995	9.07
2004	9.03
1982	9.00
2002	8.99
1999	8.93

```
%%nose
In [64]:
          from decimal import Decimal as D
          last_output = _
          def test_output_type():
              assert str(type(last_output)) == "<class 'sql.run.ResultSet'>", \
              "Please ensure an SQL ResultSet is the output of the code cell."
          results = last_output.DataFrame()
          def test_results():
              assert results.shape == (10, 2), \
              "Make sure to limit the query to only ten results."
              assert results.columns.tolist() == ["year", "avg_critic_score"], \
              'The results should have two columns, called "year" and "avg critic score".'
              assert last_output.DataFrame().loc[0, 'year'] == 1990, \
              "The year with the highest score should be 1990."
              assert last_output.DataFrame().loc[0, 'avg_critic_score'] == D('9.80'), \
              "The highest average critic score should be 9.80."
```

Out[64]: 2/2 tests passed

# 4. Was 1982 really that great?

The range of great years according to critic reviews goes from 1982 until 2020: we are no closer to finding the golden age of video games!

Hang on, though. Some of those avg\_critic\_score values look like suspiciously round numbers for averages. The value for 1982 looks especially fishy. Maybe there weren't a lot of video games in our dataset that were released in certain years.

Let's update our query and find out whether 1982 really was such a great year for video games.

```
In [65]:
          %%sql
          -- Paste your query from the previous task; update it to add a count of games re
          -- Update the query so that it only returns years that have more than four review
          select
              year,
              round(avg(critic score),2) as avg critic score,
              count(*) as num games
          from game sales as g
          inner join reviews as r
          on g.game=r.game
          group by year
          having count(*) >=4
          order by avg(critic score) desc
          limit 10;
          * postgresql:///games
         10 rows affected.
Out[65]: year avg_critic_score num_games
```

year	avg_critic_score	num_games
1998	9.32	10
2004	9.03	11
2002	8.99	9
1999	8.93	11
2001	8.82	13
2011	8.76	26
2016	8.67	13
2013	8.66	18
2008	8.63	20
2012	8.62	12

```
In [66]:
          %%nose
          from decimal import Decimal as D
          last_output = _
          def test_output_type():
              assert str(type(last_output)) == "<class 'sql.run.ResultSet'>", \
              "Please ensure an SOL ResultSet is the output of the code cell."
          results = last output.DataFrame()
          def test results():
              assert results.shape == (10, 3), \
              "Make sure to limit the query to only ten results."
              assert set(last_output.DataFrame().columns) == set(["year", "num_games", "av
              'The results should have three columns: "year", "num games", and "avg critic
              assert last output.DataFrame().loc[0, 'year'] == 1998, \
              "The year with the highest score should be 1998."
              assert last output.DataFrame().loc[0, 'num games'] == 10, \
              "In the year with the highest critic score, there were 10 games released."
              assert last_output.DataFrame().loc[0, 'avg_critic_score'] == D('9.32'), \
              "The highest average critic score should be 9.32."
```

Out[66]: 2/2 tests passed

#### 5. Years that dropped off the critics' favorites list

That looks better! The num\_games column convinces us that our new list of the critics' top games reflects years that had quite a few well-reviewed games rather than just one or two hits. But which years dropped off the list due to having four or fewer reviewed games? Let's identify them so that someday we can track down more game reviews for those years and determine whether they might rightfully be considered as excellent years for video game releases!

It's time to brush off your set theory skills. To get started, we've created tables with the results of our previous two queries:

## top\_critic\_years

column	type	meaning
year	int	Year of video game release
avg_critic_score	float	Average of all critic scores for games released in that year

#### top\_critic\_years\_more\_than\_four\_games

column	type	meaning
year	int	Year of video game release
num_games	int	Count of the number of video games released in that year
avg_critic_score	float	Average of all critic scores for games released in that year

```
In [67]: %%sql

-- Select the year and avg_critic_score for those years that dropped off the cri
-- Order the results from highest to lowest avg_critic_score
    SELECT year, avg_critic_score
    FROM top_critic_years
    EXCEPT
    SELECT year, avg_critic_score
    FROM top_critic_years_more_than_four_games
    ORDER BY avg_critic_score DESC;
```

\* postgresql://games 6 rows affected.

```
Out[67]:
```

year	avg_critic_score
1990	9.80
1992	9.67
2020	9.20
1993	9.10
1995	9.07
1982	9.00

"There should be six years that dropped off the critics' favorite list after

assert results.columns.tolist() == ["year", "avg critic score"], \

assert results.shape == (6, 2), \

```
'The results should have two columns: "year" and "avg_critic_score".'
assert last_output.DataFrame().loc[5, 'year'] == 1982, \
"The last year returned by the query should be 1982."
assert last_output.DataFrame().loc[5, 'avg_critic_score'] == 9.00, \
"1982's average critic score should be 9.00."
```

Out[68]: 2/2 tests passed

# 6. Years video game players loved

Based on our work in the task above, it looks like the early 1990s might merit consideration as the golden age of video games based on critic\_score alone, but we'd need to gather more games and reviews data to do further analysis.

Let's move on to looking at the opinions of another important group of people: players! To begin, let's create a query very similar to the one we used in Task Four, except this one will look at user\_score averages by year rather than critic\_score averages.

```
In [69]:
          %%sql
          -- Select year, an average of user score, and a count of games released in a giv
          -- Include only years with more than four reviewed games; group data by year
          -- Order data by avg_user_score, and limit to ten results
          select
              year,
              round(avg(user score),2) as avg user score,
              count(*) as num games
          from game_sales as g
          inner join reviews as r
          on g.game=r.game
          group by year
          having count(*) >=4
          order by avg(user_score) desc
          limit 10;
```

\* postgresql:///games

10 rows affected.

Out[69]:	year	avg_user_score	num_games
	1997	9.50	8
	1998	9.40	10
	2010	9.24	23
	2009	9.18	20
	2008	9.03	20
	1996	9.00	5
	2005	8.95	13
	2006	8.95	16
	2000	8.80	8

```
year avg_user_score num_games
1999 8.80 11
```

```
In [70]:
          %%nose
          last_output = _
          def test output type():
              assert str(type(last_output)) == "<class 'sql.run.ResultSet'>", \
              "Please ensure an SQL ResultSet is the output of the code cell."
          results = last output.DataFrame()
          def test results():
              assert results.shape == (10, 3), \
              "Don't forget to limit the query results to ten."
              assert set(results.columns.tolist()) == set(["year", "num_games", "avg_user_
              'The results should have three columns: "year", "num_games", and "avg_user_s
              assert last_output.DataFrame().loc[0, 'year'] == 1997, \
              "The year with the highest user score should be 1997."
              assert last output.DataFrame().loc[0, 'num games'] == 8, \
              "In the year with the highest user score, there were eight games released."
              assert last_output.DataFrame().loc[0, 'avg_user_score'] == 9.50, \
              "The highest average user score should be 9.50."
```

Out[70]: 2/2 tests passed

# 7. Years that both players and critics loved

Alright, we've got a list of the top ten years according to both critic reviews and user reviews. Are there any years that showed up on both tables? If so, those years would certainly be excellent ones!

Recall that we have access to the top\_critic\_years\_more\_than\_four\_games table, which stores the results of our top critic years query from Task 4:

#### top\_critic\_years\_more\_than\_four\_games

column	type	meaning
year	int	Year of video game release
num_games	int	Count of the number of video games released in that year
avg_critic_score	float	Average of all critic scores for games released in that year

We've also saved the results of our top user years query from the previous task into a table:

# top\_user\_years\_more\_than\_four\_games

column type meaning	
---------------------	--

```
year int Year of video game release
num_games int Count of the number of video games released in that year
avg_user_score float Average of all user scores for games released in that year
```

```
In [71]:
          %%sql
          -- Select the year results that appear on both tables
          select a.year from top_critic_years_more_than_four_games as a
          inner join top_user_years_more_than_four_games as b
          on a.year=b.year
          * postgresql://games
         3 rows affected.
          year
Out[71]:
          1998
          2002
          2008
In [72]:
          %%nose
          last_output = _
          def test output type():
              assert str(type(last output)) == "<class 'sql.run.ResultSet'>", \
              "Please ensure an SQL ResultSet is the output of the code cell."
          results = last output.DataFrame()
          def test results():
              assert results.shape == (3, 1), \
              "There should be three years present in both tables."
              assert results.columns.tolist() == ["year"], \
              'The results should just have one column: "year".'
              assert last output.DataFrame().loc[0, 'year'] == 1998, \
              "The first year returned by the query should be 1998."
```

Out[72]: 2/2 tests passed

#### 8. Sales in the best video game years

Looks like we've got three years that both users and critics agreed were in the top ten! There are many other ways of measuring what the best years for video games are, but let's stick with these years for now. We know that critics and players liked these years, but what about video game makers? Were sales good? Let's find out.

This time, we haven't saved the results from the previous task in a table for you. Instead, we'll use the query from the previous task as a subquery in this one! This is a great skill to have, as

we don't always have write permissions on the database we are querying.

```
In [73]:
          %%sql
          -- Select year and sum of games sold, aliased as total games sold; order results
          -- Filter game sales based on whether each year is in the list returned in the p
          select year, sum(games_sold) as total_games_sold from game_sales
          where year in (select a.year from top_critic_years_more_than_four_games as a
          inner join top user years more than four games as b
          on a.year=b.year)
          group by year
          order by total games sold desc
          * postgresql://games
         3 rows affected.
Out[73]: year total_games_sold
         2008
                        175.07
          1998
                        101.52
          2002
                         58.67
In [74]:
          %%nose
          from decimal import Decimal as D
          last output =
          def test output type():
              assert str(type(last_output)) == "<class 'sql.run.ResultSet'>", \
              "Please ensure an SQL ResultSet is the output of the code cell."
          results = last output.DataFrame()
          def test results():
              assert results.shape == (3, 2), \
              "There should be games sales data for three years: the same three years from
              assert results.columns.tolist() == ["year", "total games sold"], \
              'The results should have two columns: "year" and "total games sold".'
              assert last output.DataFrame().loc[0, 'year'] == 2008, \
              "Just like in the last query, the first year returned should be 2008."
              assert last output.DataFrame().loc[0, 'total games sold'] == D('175.07'), \
              "In 2008, the total games sold value should be 175.07."
```
